

# TAZO®-B

Broadcast Treatment for Turf

The active ingredient found in TAZO®-B is the bacteria Azospirillum. Azospirillum has been found to increase root mass through University studies and independent tests. Azospirillum is a bacteria that can be found in most soils, but at very low populations. Increasing the amount of Azospirillum in the soil is beneficial for the turf. The most notable benefit of Azospirillum is it's ability to fix nitrogen and the ability to stimulate root growth.

## Benefits:

- Fixes Nitrogen
- Stimulates Rooting
- Increases Growth
- Increases Stress Tolerance
- Doesn't Burn Turf

Our formulation of TAZO®-B as a liquid broadcast application brings an additional benefit "ease of use" for the user. It can be applied to the turf by spraying it in a tank sprayer for larger applications or with a hose end sprayer.

Once applied and watered in, TAZO®-B travels to the roots and starts to work. This application eliminates the appearance of common fertilizer granular products, and the concern walking and/or playing on recently treated turf.

TAZO®-B once watered in, will not run-off and cause ground water contamination concerns found in common fertilizers.
