

TAZO®-ST

Seed Treatment for Turf

TAZO®-ST Dry and Liquid is a easy method of applying Stabilized Azospirillum Bacteria to the seed before planting it in the soil. The bacteria adheres to the seed coat and is available and viable at the time of planting.

Once the treated seed is planted the roots and the bacteria unite and create a dynamic interaction. The Azospirillum bacteria starts fixing atmospheric nitrogen for the plant. The bacteria exude compounds that stimulate root growth. This creates even more attachment sites for the bacteria - "a win / win situation." These functions allow the plant to better utilize the available soil nutrients and acquire Nitrogen from sources other than the applied elemental Nitrogen.

TAZO®-ST can be mixed with the seed with various equipment ranging from a bucket mix method to commercial seed treaters.

Benefits:

- Fixes Nitrogen
- Stimulates Rooting
- Faster Germination
- Increases Stress Tolerance
